

Bootstrap project folder

(MSK 999/- pack)

Hi,

I am sending you a Bootstrap project / folder - [Click here to download](#)

Extract that zip file and open the containing folder on VS Code or any other editor.
Please observe that it contains different folders like javascript, webpack, typescript, react, interview etc.,

Notice how I am maintaining all the bootstrap templates of everything that I am learning on a day-to-day basis.

Here is what I want you to do:

1. Browse through all the files and the structure and get an idea of where things are.
2. Start adding your own cheat sheets and code snippets into this bootstrap folder.
3. Study more features of JavaScript, TypeScript, and React and grow this bootstrap folder.
4. Create your own cheat sheets and place them inside for reference / lookup.
5. Create a git repo and push all the contents into it so that you can keep pushing new changes.
6. Solve more interview questions and document the programs inside the interview folder.

Once you get used to this structural learning and documentation process, I am sure you will be able to remember many many concepts and crack the upcoming interviews.
The best part is that this is not specific to 1 company. You can use this structure to give interviews at any Fortune 500 company.

This method has definitely helped me to crack multiple interviews.
I believe it will help you too.

All the best,
Manoj
